

Bug Report Table

Environment Section

- Application: Conduit (Real World OSS Project)
- Browser: Google Chrome
- Testing Type: Manual Functional Testing
- Date Tested: 01 June 2026

#	Title Summary /	Steps to Reproduce	Expected vs Actual	Severity	Suspected Cause
1	Registration accepts whitespace-only credentials	1. Open Sign Up page. 2. Enter spaces only in Username field. 3. Enter spaces only in Email field. 4. Enter spaces only in Password field. 5. Click Sign Up.	Expected: Registration should be blocked and validation errors should be displayed. Actual: Account created successfully using whitespace-only values.	High	Input values are not trimmed before validation.
2	Registration accepts invalid email format	1. Open Sign Up page. 2. Enter Username: ayush. 3. Enter Email: ayush. 4. Enter a valid password. 5. Click Sign Up.	Expected: Invalid email error should be displayed and registration should be blocked. Actual: Account created successfully with an invalid email format.	High	Missing email format validation.
3	Article creation accepts whitespace-only content	1. Log in to the application. 2. Create a new article. 3. Enter spaces only in required fields. 4. Click Publish Article.	Expected: Validation error should be displayed and article should not be published. Actual: Article published successfully with whitespace-only content.	High	Whitespace validation missing.
4	Profile image URL field accepts invalid values	1. Open Settings page. 2. Enter cccc in the Profile Image URL field. 3. Click Update Settings.	Expected: Invalid URL error should be displayed. Actual: Invalid value saved successfully.	Medium	URL format validation missing.
5	Technical validation messages exposed to users	1. Open Settings page. 2. Enter invalid values in profile fields. 3. Save changes.	Expected: User-friendly validation messages should be displayed. Actual: Technical messages such as "body username is a string of less than 60 chars" are shown directly to users.	Low	Backend validation errors are displayed directly without user-friendly formatting.
6	Missing Forgot Password functionality on login page	1. Open Sign In page. 2. Observe available options for account recovery.	Expected: A Forgot Password option should be available for account recovery. Actual: No password recovery option is provided.	Medium	Password recovery feature not implemented.

Screenshots

Screenshot 1:

Figure 1 – In email enter only white space

Figure 2 – and successful account creation.

Figure 1 – Registration accepted invalid email format.

Figure 2 – Signup Successful.

Screenshot 3: Whitespace-only article successfully published.

Screenshot 4: Settings page accepting: cccc as image URL.

Screenshot 5: Technical validation message- body username is a string of less than 60 chars

Screenshot 6: Login page does not provide a Forgot Password or account recovery option.

Root Cause Analysis – Registration Accepts Whitespace-Only Credentials

The registration form allows users to create accounts using whitespace-only values in username, email, and password fields. During testing, account creation succeeded even when these fields contained only space characters. This indicates that the application validates input based on string length without trimming leading and trailing whitespace. As a result, values that appear empty to users are treated as valid input. The issue impacts data integrity, user management, and authentication reliability because invalid accounts can be created and stored in the system. The same behavior was observed in article creation and profile updates, suggesting a common validation pattern across multiple forms. The issue can be resolved by applying whitespace trimming before validation and enforcing validation checks on both frontend and backend systems.

Project Title

Cryptocurrency Price Alert Workflow using n8n

Objective

The objective of this project is to automate cryptocurrency price monitoring and send email notifications when the cryptocurrency price exceeds a predefined threshold value

Tools and Technologies Used

- n8n
- CoinGecko API
- Gmail
- Google Chrome

Workflow Design

The workflow was developed using n8n to automate cryptocurrency price tracking.

The workflow performs the following tasks:

1. Fetches cryptocurrency price data from CoinGecko API.
2. Evaluates the price against a predefined threshold.
3. Retrieves additional cryptocurrency details.
4. Formats the output data.
5. Sends an email notification through Gmail.

Screenshot

Workflow Implementation

Step 1: Manual Trigger Node

The workflow starts using the Manual Trigger node. It initiates the execution whenever the user clicks the Execute Workflow button.

Screenshot: Manual Trigger Node Configuration

Step 2: HTTP Request Node

The HTTP Request node fetches real-time Bitcoin price data from the CoinGecko API.

API Used:

https://api.coingecko.com/api/v3/simple/price?ids=bitcoin&vs_currencies=usd

Screenshot: HTTP Request Node Fetching Bitcoin Price

IF Node

The IF node checks whether the Bitcoin price is greater than the predefined threshold value.

Condition:

Bitcoin Price > 70000

If the condition evaluates to TRUE, the workflow continues to the next step.

Screenshot :IF Node Price Validation Condition

Gmail Node

The Gmail node sends an automated email notification containing the cryptocurrency information.

Screenshot: Gmail Notification Configuration

Output

Sample Output:

Field	Value
Crypto	Bitcoin
Symbol	BTC

Field	Value
Price	72157 USD
Status	High Price Alert

Screenshot

Error Handling: Continue On Fail was enabled on the HTTP Request node so the workflow would not crash silently if the API call failed.

Result

The workflow successfully fetched real-time Bitcoin price data from CoinGecko API, evaluated the threshold condition, retrieved additional cryptocurrency details, formatted the required information, and sent automated email notifications through Gmail.

Conclusion

The Cryptocurrency Price Alert Workflow successfully demonstrates API integration, workflow automation, conditional logic implementation, data transformation, and email notification services using n8n. The project achieved its objective of automatically monitoring cryptocurrency prices and generating alerts whenever the defined condition was met.
